

**CLAIM LISTING**

1. (currently amended) A method for a communication infrastructure to speed uplink data setup, the method comprising the steps of:

reserving, by a packet control unit (PCU) in the communication infrastructure, packet data resources needed for an uplink connection from a communication unit of a plurality of communication units to the communication infrastructure that has not yet been requested by the communication unit and is not yet needed by the communication unit, wherein the packet data resources comprise at least a portion of a packet data channel;

sending, by the PCU to a basestation transceiver system (BTS), a message identifying the packet data resources reserved;

transmitting, by the PCU via the BTS, an uplink transmit allowance message for the at least a portion of the packet data channel; and

receiving, by the PCU, an indication that the packet data resources reserved have been used to establish the uplink connection, wherein the packet data resources comprise at least one timeslot of a packet data channel, a timing advance index, and a temporary flow identifier.

2. (canceled)

3. (original) The method of claim 1 wherein the step of receiving the indication comprises receiving a message from the BTS indicating that the BTS assigned the packet data resources to the communication unit.

4. (original) The method of claim 1 wherein the step of receiving the indication comprises receiving data from the communication unit via the uplink connection.

5. (currently amended)The method of claim 1 further comprising the step of sending, by the PCU to the BTS, a message canceling the a reservation of the packet data resources reserved.
6. (original) The method of claim 1 further comprising the step of after the indication is received, reserving packet data resources needed for a second uplink connection from a second communication unit of the plurality of communication units to the communication infrastructure that has not yet been requested by the second communication unit and is not yet needed by the second communication unit.
7. (original) The method of claim 1 further comprising the step of after the indication is received and if communication unit demand for uplink connections is above a threshold, reserving packet data resources needed for a second uplink connection from a second communication unit of the plurality of communication units to the communication infrastructure that has not yet been requested by the second communication unit and is not yet needed by the second communication unit.
8. (original) The method of claim 1 further comprising the step of repeatedly transmitting, by the PCU via the BTS, the uplink transmit allowance message for the at least a portion of the packet data channel.
9. (original) The method of claim 1 further comprising the step of reserving at least one additional packet data resource needed for additional uplink connections from additional communication units of the plurality of communication units to the communication infrastructure that have not yet been requested by the additional communication units and are not yet needed by the additional communication units.
10. (currently amended)The method of claim 9 further comprising the step of determining the a number of additional packet data resources to reserve based on a rate of indications that packet data resources reserved have been used to establish uplink connections.

11. (currently amended)The method of claim 9 further comprising the step of repeatedly transmitting, by the PCU via the BTS, uplink transmit allowance messages for at least some of the at least one additional packet data resource reserved, wherein ~~the~~ a relative frequency of transmission of each uplink transmit allowance message is based on ~~the~~ a relative order of reservation of each of the corresponding packet data ~~resources~~ resource.

12. (currently amended)The method of claim 1 wherein the step of reserving comprises the step of reserving, by the PCU, the packet data resources usable by the greatest number of communication units of the plurality of communication units.

13. (currently amended) A method for a communication infrastructure to speed data uplink setup, the method comprising the steps of:

receiving, by a BTS from a PCU, a message identifying packet data resources reserved, wherein the packet data resources reserved comprise at least a portion of a packet data channel needed for an uplink connection from a communication unit to the communication infrastructure that has not yet been requested by the communication unit and is not yet needed by the communication unit;

receiving, by the BTS from the communication unit, a request for an uplink connection;

assigning, by the BTS to the communication unit, the packet data resources reserved; and

transmitting, by the BTS to the communication unit, an assignment message identifying the packet data resources assigned to the communication unit, wherein the packet data resources comprise at least one timeslot of a packet data channel, a timing advance index, and a temporary flow identifier.

14. (original) The method of claim 13 further comprising the step of sending, by the BTS to the PCU, an indication that the packet data resources reserved have been assigned.

15. (canceled)

16. (currently amended) A communication infrastructure comprising:  
a packet control unit (PCU) capable of reserving packet data resources needed for an uplink connection from a communication unit to the communication infrastructure that has not yet been requested by the communication unit and is not yet needed by the communication unit, wherein the packet data resources comprise at least a portion of a packet data channel, capable of sending to a basestation transceiver system (BTS) a message identifying the packet data resources reserved, capable of transmitting via the BTS an uplink transmit allowance message for the at least a portion of the packet data channel, and capable of receiving an indication that the packet data resources reserved have been used to establish the uplink connection, wherein the packet data resources comprise at least one timeslot of a packet data channel, a timing advance index, and a temporary flow identifier.
17. (original) The communication infrastructure of claim 16 wherein the PCU is further capable of reserving at least one additional packet data resource needed for additional uplink connections from additional communication units to the communication infrastructure that have not yet been requested by the additional communication units and are not yet needed by the additional communication units.
18. (original) The communication infrastructure of claim 17 wherein the PCU is further capable of determining the number of additional packet data resources to reserve based on a rate of indications that packet data resources reserved have been used to establish uplink connections.
19. (currently amended) The communication infrastructure of claim 16 wherein the PCU is further capable of repeatedly transmitting via the BTS uplink transmit allowance messages for at least some of the at least one additional packet data resource reserved, wherein the a relative frequency of transmission of each uplink transmit

allowance message is based on the a relative order of reservation of each of the corresponding packet data resources resource.

20. (currently amended) A communication infrastructure comprising:

a basestation transceiver system (BTS) capable of receiving from a PCU a message identifying packet data resources reserved, wherein the packet data resources reserved comprise at least a portion of a packet data channel needed for an uplink connection from a communication unit to the communication infrastructure that has not yet been requested by the communication unit and is not yet needed by the communication unit, capable of receiving from the communication unit a request for an uplink connection, capable of assigning to the communication unit the packet data resources reserved, and capable of transmitting to the communication unit an assignment message identifying the packet data resources being assigned to the communication unit, wherein the packet data resources comprise at least one timeslot of a packet data channel, a timing advance index, and a temporary flow identifier.

21. (original) The communication infrastructure of claim 20 wherein the BTS is further capable of sending to the PCU an indication that the packet data resources reserved have been assigned.
